

Presentation

Acutely unwell.

Patient Data

Age: 30 years

Gender: Female

Extensive consolidation and air bronchograms with loss of the right hemidiaphragm in keeping with right lower lobe consolidation. In this setting most likely community-acquired pneumonia. Whether or not there is an associated small pleural effusion is uncertain. Minor patchy airspace opacity is also in the left midzone.

Case Discussion

Chest x-ray demonstrates extensive consolidation and air bronchograms. Patient treated in ICU for numerous days.

Streptococcus pneumoniae isolated.
