

Presentation

Fever and two days of odynophagia; positive test for SARS-CoV-2 RNA.

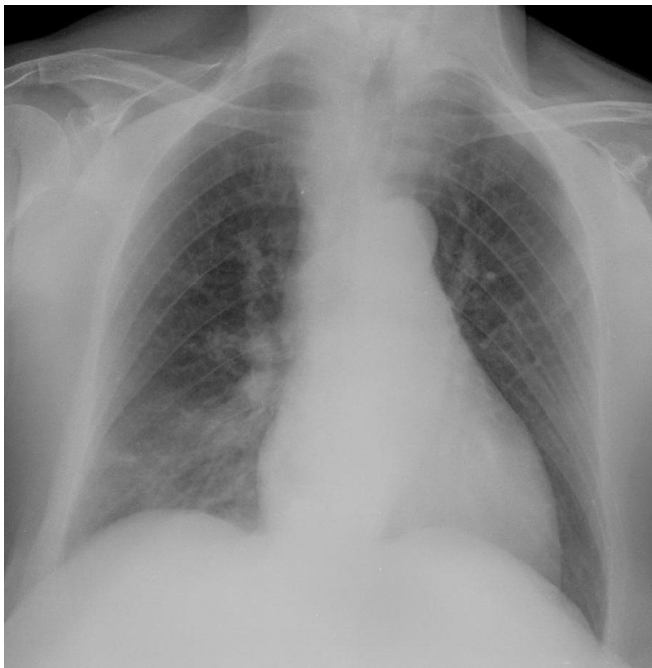

Patient Data

Age: 70 years

Gender: Female

Opacity in the right lower lobe.

Slight increasing of the opacity in the right lower lung field, without changes in the other fields.

Case Discussion

The patient had normal oxygen saturation and no lymphopenia.

Although SARS-CoV-2 infection (COVID-19) is described as possibly having a rapidly progressive course, it can sometimes manifest itself as ground glass / ill-defined consolidation that remains relatively stable.

In our case, the patient, despite her age, remained clinically stable and was discharged to home quarantine.
